**China's Urban Construction Land Development** Jul 20 2022 This book examines the nature and internal dynamics of China's urban construction land (UCL) development, drawing insights from the recently developed theory of regional political ecology. Based on the author's original research, it identifies two different types of UCL development in China, namely top-down, formal development in the legal and regulated domain, and spontaneous and informal, bottom-up development in the semi-legal, poorly regulated gray domain. Presenting a systematic analysis and comparison, it reveals a scale and speed of informal land development no less significant than that of formal land development, although informal land development tends to be scattered, pervasive, difficult to

track, and largely overlooked in research and policy formation. Contrary to the popular perception of the peasantry as passive victims of land development, this book uncovers an intriguing dynamic in which the peasantry has played an increasingly (pro)active role in developing their rural land for urban uses in informal markets. Further, based on an investigation of UCL development in Beijing and Shenzhen, it shows an interesting trajectory in which the uneven growth and utilization of UCL are contingent upon the various developmental milieus in different places. China's land institutions, based on an urban-rural dual land system, are not conducive to the ultimate goal of saving and efficiently utilizing land. Accordingly, an urban-rural integrated land market and management system is highly advisable. The theoretical and empirical enquiry presented challenges the perceived notion of China's UCL development as the outcome of market demand and state supply. Further, it argues for an inclusive treatment of the informality that has characterized urbanization in many developing countries, and for a reassessment of the role played by the peasantry in land-based urbanization.

Sustainable Land Development and Restoration Mar 16 2022 Decision Consequence Analysis (DCA) is a framework for improving the quality of decision results. The framework is a systematic, multi-criteria quantification of uncertainties and the opportunities for managing and reducing the potential negative consequences of such uncertainties. DCA is demonstrated throughout Sustainable Land Development and Restoration for each stage of system based management of environmental issues. DCA links disciplines and incorporates components of risk modelling, probability modelling and the psychology of decision making. Its goal is to provide a comprehensive unbiased decision making framework. Its foundation is accurately defining your problem statement and clearly vetting your objectives to build a structure for meaningful analysis of data. Employment of DCA consistently throughout the environmental industry can reduce decibel-driven, agenda-laden decision making, streamline expenditure of resources (financial, human, natural), and provide a clear path to the sustainable maintenance of balanced environmental systems as the penultimate objective. Sustainable Land Development and Restoration provides a toolbox to both the novice and experienced environmental practitioner of valuable techniques for addressing site specific environmental issues, as well as managing a portfolio of liabilities on an international scale. Ultimately, the authors are addressing the critical issue of balancing environmental asset balance sheets, whether on the scale of an individual project, across a company's portfolio, or for a community. The environmental manager who adopts the principles in this book will have greater confidence that environmental protection or restoration activities are providing measurable utility. The goal is that, through multidimensional resource management analysis and practices companies and societies can achieve sustainable maintenance of a balanced environmental system. Descriptions of technical, contracting and implementation processes are supported by detailed case studies to provide real world context rather than an academic exchange of theories. Techniques for addressing site specific environmental issues Multidimensional resource management analysis Case narrative, data base, and GIS linked
