Developing Models in Science Education Oct 16 2019 Models and modelling play a central role in the nature of science, in its conduct, in the accreditation and dissemination of its outcomes, as well as forming a bridge to technology. They therefore have an important place in both the formal and informal science education provision made for people of all ages. This book is a product of five years collaborative work by eighteen researchers from four countries. It addresses four key issues: the roles of models in science and their implications for science education; the place of models in curricula for major science subjects; the ways that models can be presented to, are learned about, and can be produced by, individuals; the implications of all these for research and for science teacher education. The work draws on insights from the history and philosophy of science, cognitive psychology, sociology, linguistics, and classroom research, to establish what may be done and what is done. The book will be of interest to researchers in science education and to those taking courses of advanced study throughout the world.

Nucleic Acid-metal Ion Interactions Jul 05 2021 The quest to understand how nucleic acids function at the most fundamental level requires a detailed understanding of nucleic acid-metal ion interactions, as RNA and DNA are polyanions, their structures depend strongly on their association with metal ions. While scientists have appreciated the intimate connection between metal ions and nucleic acid function for decades, the noncovalent, dynamic nature of these interactions makes their accurate, quantitative description a challenge. Over the past few years, the simultaneous development of solution-state spectroscopic techniques and achievement of high resolution X-ray crystal structures has provided tremendous insight into nucleic acid-metal ion interactions. This insight includes direct evidence for the importance of such interactions in determining nucleic acid structure over orders of magnitude in scale, from the folding pathways of large RNAs to the subtle modulation of DNA groove width. *Nucleic Acid-Metal Ion Interactions* provides a comprehensive review of the experimental studies that define our current understanding of the subject, with a particular emphasis on biophysical studies. The book is not merely a current review of the literature, however, as the authors also present original material and fresh perspectives. The topics covered range from crystallographic studies of transition metal coordination by single nucleotides, to the application of polyelectrolyte theory in describing the delocalized counterions that

surround nucleic acids in solution. Separate chapters describe how nucleic acid-metal interactions modulate both the kinetics and thermodynamics of RNA folding, play important roles in RNA catalysis, and how these interactions are even informing the design of new therapeutics. The book is sufficiently detailed to serve as a reference for researchers active in nucleic acids biophysics or molecular biology. Additionally, chapter authors have supplied sufficient introductory and background material to make this book an accessible first resource for students and researchers who are just beginning to explore this dynamic field.

Amino Acids as Chemical Transmitters Aug 06 2021 This volume represents the proceedings of a NATO Advanced Study Institute on Amino Acids as Chemical Transmitters, which took place at Spatind Hotel in Norway, August 14-21, 1977. The meeting is related to two previous meetings on metabolic compartmentation in the brain. The first of these meetings took place at Rockefeller Foundation, Bellagio, Italy, July 11-16, 1971 and the proceedings, Metabolic Compartmentation in Brain, were edited by R. Balazs and J. E. Cremer and published by Macmillan in 1973. The second meeting was an Advanced Study Institute on

Metabolic Compartmentation and Neurotransmission Relation to Brain Structure and Function, which was held in Oxford, September 1-8, 1974. The proceedings were edited by S. Berl, D. D. Clarke and D. Schneider and published as Volume 6 of the NATO ASI Life Science series by Plenum Press. The object of the present meeting was to review and discuss the present status of amino acids as chemical transmitters. Several issues such as electrophysiological response, localization, synthesis, release and receptor binding of transmitter candidates were discussed. The possible morphological correlates to these functions were also reviewed. During the meeting 24 leading papers were given. In addition, several of the participants presented important new findings during the discussion. Some of these have been included as short reports. The main financial support was obtained from NATO, Scientific Affairs Division.
