**Understanding and Using the Controller Area Network Communication Protocol** Sep 18 2022 This book to offers a hands-on guide to designing, analyzing and debugging a communication infrastructure based on the Controller Area Network (CAN) bus. Although the CAN bus standard is well established and currently used in most automotive systems, as well as avionics, medical systems and other devices, its features are not fully understood by most developers, who tend to misuse the network. This results in lost opportunities for better efficiency and performance. These authors offer a comprehensive range of architectural solutions and domains of analysis. It also provides formal models and analytical results, with thorough discussion of their applicability, so that it serves as an invaluable reference for researchers and students, as well as practicing engineers.

**Army Networks** Feb 23 2023 In 2011, the US. Army began a major undertaking to modernize its tactical network to improve communication and provide needed information to soldiers on the battlefield. The Army has identified the network as its number one modernization priority requiring approximately \$3 billion per year indefinitely. Network Integration Evaluations (NIEs) provide semi-annual assessments of newly developed systems. Given the importance of the network, this report examines (1) the results of the NIEs conducted to date and the extent to which the Army has procured and fielded network solutions, and (2) Army actions to enhance the NIE process. Tables. This is a print on demand report.

**Prediction of Burnout** Oct 27 2020 This Study about burnout in nurses takes a different approach than all prior empirical work on this topic given that nonlinear relationships between job stressors, personal factors and the three burnout dimensions are investigated using artificial neural networks, a type of computer simulation that is especially well suited to capturing nonlinearities in data. The burnout process is related to organizational, personal, interpersonal, social, and cultural variables and these relationships are not exclusively linear. Due to this nonlinearity, hierarchical stepwise multiple regression or other linear statistical methods, may perhaps not be the most suitable method to analyze the data effectively. Compounding the dilemma is that multiple linear regression returns no direct indicator with regard to whether the data is best portrayed linearly. In standard least squares linear regression, the model has to be specified previously and assumptions have to be made concerning the underlying relationship between independent variables and dependent variables. Since by default, the relationship is often assumed to be linear, the regression line can be erroneous even though the error of the fit can be small. Artificial neural networks do not have these limitations with nonlinearities and are therefore predestined for the analysis of nonlinear relationships. This study is a complex research of burnout that includes socio-demographic characteristics, job stressors, and hardy personality. Typically, studies on burnout have investigated primarily the effects of organizational factors. Recently, authors revealed and confirmed the important effects of personality variables on the burnout process. The objective of developing an instrument to predict burnout (NuBuNet abbreviation for Nursing Burnout Network) in nurses is accomplished by using two different types of artificial neural networks: A three-layer feed-forward network with the gradient decent back-propagation training algorithm and a radial basis function network with two different training algorithms: the pseudo inverse algorithm and a hybrid algorithm. The implementation of the artificial neural networks used in this study is carried out in a MATLAB development environment. Instead of writing each artificial neural network as a stand-alone program, an object-oriented programming style is chosen to include all functions into one single system. Three artificial neural networks are implemented in the technical part of this study. A self-organizing map, a three-layer back-propagation network, and a radial basis function network. Whereas the self-organizing map is only used in the data preparation process, the back-propagation network and the radial basis function network is used in the burnout model approximation. After an exhaustive training and simulation session including more than 150 networks and an analysis of all results, the network with the best results is chosen to be compared to the hierarchical stepwise multiple regression. The network paradigms are better suited for the analysis of burnout than hierarchical stepwise multiple regression. Both can capture nonlinear relationships that are relevant for theory development. At predicting the three burnout sub-dimensions emotional exhaustion, depersonalization, and lack of personal accomplishment however, the radial basis function network is slightly better than the three-layer feed-forward network.

**Computational Intelligence for Network Structure Analytics** Feb 11 2022 This book presents the latest research advances in complex network structure analytics based on computational intelligence (CI) approaches, particularly evolutionary optimization. Most if not all network issues are actually optimization problems, which are mostly NP-hard and challenge conventional optimization techniques. To effectively and efficiently solve these hard optimization problems, CI based network structure analytics offer significant advantages over conventional network analytics techniques. Meanwhile, using CI techniques may facilitate smart decision making by providing multiple options to choose from, while conventional methods can only offer a decision maker a single suggestion. In addition, CI based network structure analytics can greatly facilitate network modeling and analysis. And employing CI techniques to resolve network issues is likely to inspire other fields of study such as recommender systems, system biology, etc., which will in turn expand CI's scope and applications. As a comprehensive text, the book covers a range of key topics, including network community discovery, evolutionary optimization, network structure balance analytics, network robustness analytics, community-based personalized recommendation, influence maximization, and biological network alignment. Offering a rich blend of theory and practice, the book is suitable for students, researchers and practitioners interested in network analytics and computational intelligence, both as a textbook and as a reference work.

**Network Formation and Information Acquisition** Feb 28 2021 This paper develops a model where players acquire information personally or by forming connections and the benefits that reach them depend only on the maximum of the information collected personally or by neighbours. As long as only direct connections matter periphery sponsored star is the only equilibrium when forming connections is cheaper than acquiring information. Though periphery sponsored star also turns out to be the efficient network under such situation, the level of information sustained under efficient profile is higher than that under an equilibrium. The paper also shows that when indirect connections become relevant, not only is the star no longer the unique equilibrium, under certain conditions star ceases to be an equilibrium altogether.

**Motivation. Action. Results.** Jun 15 2022 Want to motivate your network marketing team into action? We don't have to be a screaming drill instructor to get the job done. Through contests, recognition, goal-setting, fill-out forms, personal development and other motivational techniques, we can do our part to create momentum in our teams. Our new distributors need motivation to overcome the negativity of their initial prospects. Our experienced distributors need motivation when they run out of prospects they know. Learn the motivational values and triggers our team members have, and learn to use them wisely. By balancing internal motivation and external motivation methods, we can be more effective motivators. As leaders, we need to be the spark that ignites our team into action. We can teach our team exactly what to do. However, we must motivate them to do it. Enjoy this book of case studies and examples of exactly how to be a motivating team leader. We can't do all the work ourselves. We need help. Our teams have to be in action for us to duplicate. Put your team into momentum and get results fast. ?Order your copy now!

**Social Networks and Surveillance for Society** Oct 07 2021 This book focuses on recent technical advancements and state-of-the-art technologies for analyzing characteristic features and probabilistic modelling of complex social networks and decentralized online network architectures. Such research results in applications related to surveillance and privacy, fraud analysis, cyber forensics, propaganda campaigns, as well as for online social networks such as Facebook. The text illustrates the benefits of using advanced social network analysis methods through application case studies based on practical test results from synthetic and real-world data. This book will appeal to researchers and students working in these areas.

**Social Networks: A Framework of Computational Intelligence** Dec 09 2021 This volume provides the audience with an updated, in-depth and highly coherent material on the conceptually appealing and practically sound information technology of Computational Intelligence applied to the analysis, synthesis and evaluation of social networks. The volume involves studies devoted to key issues of social networks including community structure detection in networks, online social networks, knowledge growth and evaluation, and diversity of collaboration mechanisms. The book engages a wealth of methods of Computational Intelligence along with well-known techniques of linear programming, Formal Concept Analysis, machine learning, and agent modeling. Human-centricity is of paramount relevance and this facet manifests in many ways including personalized semantics, trust metric, and personal knowledge management; just to highlight a few of these aspects. The contributors to this volume report on various essential applications including cyber attacks detection, building enterprise social networks, business intelligence and forming collaboration schemes. Given the subject area, this book is aimed at a broad audience of researchers and practitioners. Owing to the nature of the material being covered and a way it is organized, the volume will appeal to the well-established communities including those active in various disciplines in which social networks, their analysis and optimization are of genuine relevance. Those involved in operations research, management, various branches of engineering, and economics will benefit from the exposure to the subject matter.

**The Amoeba Interaction Network** Jul 04 2021

**AI 2003: Advances in Artificial Intelligence** Oct 15 2019 Consider the problem of a robot (algorithm, learning mechanism) moving along the real line attempting to locate a particular point  $p$ . To assist the mechanism, we assume that it can communicate with an Environment ("Oracle") which guides it with information regarding the direction in which it should go. If the Environment is deterministic the problem is the "Deterministic Point - cation Problem" which has been studied rather thoroughly [1]. In its pioneering version [1] the problem was presented in the setting that the Environment could charge the robot a cost which was proportional to the distance it was from the point sought for. The question of having multiple communicating robots locate a point on the line has also been studied [1, 2]. In the stochastic version of this problem, we consider the scenario when the learning mechanism attempts to locate a point in an interval with stochastic (i. e. , possibly erroneous) instead of deterministic responses from the environment. Thus when it should really be moving to the "right" it may be advised to move to the "left" and vice versa. Apart from the problem being of importance in its own right, the stochastic pointlocation problem also has potential applications in solving optimization problems. In many optimization solutions - for example in image processing, p- tern recognition and neural computing [5, 9, 11, 12, 14, 16, 19], the algorithm works its way from its current solution to the optimal solution based on information that it currently has. A crucial question is one of determining the parameter which the optimization algorithm should use.

**Intelligent Data Engineering and Automated Learning -- IDEAL 2012** Feb 17 2020 This book constitutes the refereed proceedings of the 13th International Conference on Intelligent Data Engineering and Automated Learning, IDEAL 2012, held in Natal, Brazil, in August 2012. The 100 revised full papers presented were carefully reviewed and selected from more than 200 submissions for inclusion in the book and present the latest theoretical advances and real-world applications in computational intelligence.

**A First Course in Network Theory** Nov 08 2021 The study of network theory is a highly interdisciplinary field, which has emerged as a major topic of interest in various disciplines ranging from physics and mathematics, to biology and sociology. This book promotes the diverse nature of the study of complex networks by balancing the needs of students from very different backgrounds. It references the most commonly used concepts in network theory, provides examples of their applications in solving practical problems, and clear indications on how to analyse their results. In the first part of the book, students and researchers will discover the quantitative and analytical tools necessary to work with complex networks, including the most basic concepts in network and graph theory, linear and matrix algebra, as well as the physical concepts most frequently used for studying networks. They will also find instruction on some key skills such as how to proof analytic results and how to manipulate empirical network data. The bulk of the text is focused on instructing readers on the most useful tools for modern practitioners of network theory. These include degree distributions, random networks, network fragments, centrality measures, clusters and communities, communicability, and local and global properties of networks. The combination of theory, example and method that are presented in this text, should ready the student to conduct their own analysis of networks with confidence and allow teachers to select appropriate examples and problems to teach this subject in the classroom.

**Network and Parallel Computing** Oct 19 2022 This book constitutes the proceedings of the 11th IFIP WG 10.3 International Conference on Network and Parallel Computing, NPC 2014, held in Ilan, Taiwan, in September 2014. The 42 full papers and 24 poster papers presented were carefully reviewed and selected from 196 submissions. They are organized in topical sections on systems, networks, and architectures, parallel and multi-core technologies, virtualization and cloud computing technologies, applications of parallel and distributed computing, and I/O, file systems, and data management.

**Discrete-Time Sliding Mode Control for Networked Control System** Dec 17 2019 This book presents novel algorithms for designing Discrete-Time Sliding Mode Controllers (DSMCs) for Networked Control Systems (NCSs) with both types of fractional delays namely deterministic delay and random delay along with different packet loss conditions such as single packet loss and multiple packet loss that occur within the sampling period. Firstly, the switching type and non-switching type algorithms developed for the deterministic type fractional delay where the delay is compensated using Thiran's approximation technique. A modified discrete-time sliding surface is proposed to derive the discrete-time sliding mode control algorithms. The algorithm is further extended for the random fractional delay with single packet loss and multiple packet loss situations. The random fractional delay is modelled using Poisson's distribution function and packet loss is modelled by means of Bernoulli's function. The condition for closed loop stability in all above situations are derived using the Lyapunov function. Lastly, the efficacy of the proposed DSMC algorithms are demonstrated by extensive simulations and also experimentally validated on a servo system.

**Queueing Networks** Jan 18 2020 This handbook aims to highlight fundamental, methodological and computational aspects of networks of queues to provide insights and to unify results that can be applied in a more general manner. The handbook is organized into five parts: Part 1 considers exact analytical results such as of product form type. Topics include characterization of product forms by physical balance concepts and simple traffic flow equations, classes of service and queue disciplines that allow a product form, a unified description of product forms for discrete time queueing networks, insights for insensitivity, and aggregation and decomposition results that allow sub networks to be aggregated into single nodes to reduce computational burden. Part 2 looks at monotonicity and comparison results such as for computational simplification by either of two approaches: stochastic monotonicity and ordering results based on the ordering of the process generators, and comparison results and explicit error bounds based on an underlying Markov reward structure leading to ordering of expectations of performance measures. Part 3 presents diffusion and fluid results. It specifically looks at the fluid regime and the diffusion regime. Both of these are illustrated through fluid limits for the queueing of system stability, diffusion approximations for multi-server systems, and a system fed by Gaussian traffic. Part 4 illustrates computational and approximate results through the classical MVA (mean value analysis) and QNA (queueing network analyzer) for computing mean and variance of performance measures such as queue lengths and sojourn times; numerical approximation of response time distributions; and approximate decomposition results for large open queueing networks. spanPart 5 enlightens selected applications as spanloss networks originating from circuit switched telecommunications applications, capacity sharing originating from packet switching in data networks, and a hospital application that is of growing present day interest. spanThe book shows that spanthe intertwining progress of theory and practicespan will remain to be most intriguing and will continue to be the basis of further developments in queueing networks.

**Instant Networking** Jul 16 2022 "A fresh look at networking in the 21st century, this book joins up networking, social media, marketing and sales skills to give readers a full picture of how to network effectively both online and in the real-world"--

**The Complete Three-Volume Network Marketing Leadership Series** Dec 21 2022 Build Network Marketing Leaders Faster! Much Faster! Entire three-book leadership series by Tom "Big Al" Schreiter and Keith Schreiter Book #1: How To Build Network Marketing Leaders Volume One: Step-by-Step Creation of MLM Professionals shows us how to locate the best leader candidates and how to groom them for leadership. Learn exactly what to say and exactly what to do to change their attitudes, their thinking, and their results. Why? Because leaders are everything in network marketing. These are the long-term producers that leverage our income. We have limited time. We can only

work with a limited number of distributors. So, we must duplicate ourselves through our leaders. Ask yourself, "Do you want to be a leader? Or, do you want more leaders on your network marketing team?" Everyone says they want to have more leaders, but how? How does one find leaders? How does one create leaders? What are the things we need to teach ordinary distributors to do in order to for them become leaders? This plan doesn't happen by accident. Instead of wishing and hoping for leaders, this book will give you the step-by-step activities to create leaders. Yes, there is a plan for building leaders and it is simple to follow. Discover how to give ordinary distributors a leadership test to determine if they are ready to enter the path of leadership. Then, learn how to start their learning process with the biggest leadership lesson of all: problems. Book #2: How To Build Network Marketing Leaders Volume Two: Activities and Lessons for MLM Leaders takes our potential leaders and expands on what they can do to grow their teams faster. No one is a "natural-born leader." Babies aren't given a manual on how to be an adult. Adulthood is learned from others. So how will we teach eager distributors to become leaders? By showing, participating, experiencing ... and of course, sharing stories. Yes, they could imitate us to become leaders, but not everyone is created the same, with the same set of skills or advantages. So, there must be common lessons everyone can learn for leadership. Inside this book, you will find many ways to change people's viewpoints, to change their beliefs, and to reprogram their actions. And when these three things change, the results will naturally change too. The earnings from developing one good leader could dwarf the monthly payout of almost any retirement plan. Book #3: Motivation. Action. Results. How Network Marketing Leaders Move Their Teams adds another 172 pages of step-by-step actions and campaigns to make our leaders the best they can be. Getting results from the team is the measurement of true leadership. Want to motivate your network marketing team into action? We don't have to be a screaming drill instructor to get the job done. Through contests, recognition, goal-setting, fill-out forms, personal development and other motivational techniques, we can do our part to create momentum in our teams. Our new distributors need motivation to overcome the negativity of their initial prospects. Our experienced distributors need motivation when they run out of prospects to talk to. Learn the motivational values and triggers our team members have, and learn to use them wisely. By balancing internal motivation and external motivation methods, we can be more effective motivators. We can teach our team exactly what to do. However, we must motivate them to do it. Enjoy this book of case studies and examples of exactly how to be a motivating team leader. We can't do all the work ourselves. We need help. Put your team into momentum. Order The Complete Three-Volume Network Marketing Leadership Series now!

Combinatorial Optimization and Applications Apr 01 2021 This book constitutes the refereed proceedings of the 8th International Conference on Combinatorial Optimization and Applications, COCOA 2014, held on the island of Maui, Hawaii, USA, in December 2014. The 56 full papers included in the book were carefully reviewed and selected from 133 submissions. Topics covered include classic combinatorial optimization; geometric optimization; network optimization; optimization in graphs; applied optimization; CSoNet; and complexity, cryptography, and games.

*Optimal Network Problem Without Congestion : Some Computational Results* May 22 2020

Driving Results Through Social Networks Nov 20 2022 Driving Results Through Social Networks shows executives and managers how to obtain substantial performance and innovation impact by better leveraging these traditionally invisible assets. For the past decade, Rob Cross and Robert J. Thomas have worked closely with executives from over a hundred top-level companies and government agencies. In this groundbreaking book, they describe in-depth how these leaders are using network thinking to increase revenues, lower costs, and accelerate innovation.

**Doing Meta-Analysis with R** Jan 30 2021 Doing Meta-Analysis with R: A Hands-On Guide serves as an accessible introduction on how meta-analyses can be conducted in R. Essential steps for meta-analysis are covered, including calculation and pooling of outcome measures, forest plots, heterogeneity diagnostics, subgroup analyses, meta-regression, methods to control for publication bias, risk of bias assessments and plotting tools. Advanced but highly relevant topics such as network meta-analysis, multi-three-level meta-analyses, Bayesian meta-analysis approaches and SEM meta-analysis are also covered. A companion R package, dmetar, is introduced at the beginning of the guide. It contains data sets and several helper functions for the meta and metafor package used in the guide. The programming and statistical background covered in the book are kept at a non-expert level, making the book widely accessible. Features • Contains two introductory chapters on how to set up an R environment and do basic imports/manipulations of meta-analysis data, including exercises • Describes statistical concepts clearly and concisely before applying them in R • Includes step-by-step guidance through the coding required to perform meta-analyses, and a companion R package for the book

*Stochastic Network Calculus* Mar 12 2022 Network calculus is a theory dealing with queuing systems found in computer networks. Its focus is on performance guarantees. Central to the theory is the use of alternate algebras such as the min-plus algebra to transform complex network systems into analytically tractable systems. To simplify the analysis, another idea is to characterize traffic and service processes using various bounds. Since its introduction in the early 1990s, network calculus has developed along two tracks—deterministic and stochastic. This book is devoted to summarizing results for stochastic network calculus that can be employed in the design of computer networks to provide stochastic service guarantees. Overview and Goal Like conventional queuing theory, stochastic network calculus is based on properly defined traffic models and service models. However, while in conventional queuing theory an arrival process is typically characterized by the inter-arrival times of customers and a service process by the service times of customers, the arrival process and the service process are modeled in network calculus respectively by some arrival curve that (maybe probabilistically) upper-bounds the cumulative arrival and by some service curve that (maybe probabilistically) lower-bounds the cumulative service. The idea of using boundstocharacterize traffic and service was initially introduced for deterministic network calculus. It has also been extended to stochastic network calculus by exploiting the stochastic nature of arrival and service processes.

**Advances in Secure Computing, Internet Services, and Applications** May 02 2021 Technological advancements have extracted a vast amount of useful knowledge and information for applications and services. These developments have evoked intelligent solutions that have been utilized in efforts to secure this data and avoid potential complex problems. Advances in Secure Computing, Internet Services, and Applications presents current research on the applications of computational intelligence in order to focus on the challenge humans face when securing knowledge and data. This book is a vital reference source for researchers, lecturers, professors, students, and developers, who have interest in secure computing and recent advanced in real life applications.

Highlighting the Importance of Big Data Management and Analysis for Various Applications Sep 25 2020 This book addresses the impacts of various types of services such as infrastructure, platforms, software, and business processes that cloud computing and Big Data have introduced into business. Featuring chapters which discuss effective and efficient approaches in dealing with the inherent complexity and increasing demands in data science, a variety of application domains are covered. Various case studies by data management and analysis experts are presented in these chapters. Covered applications include banking, social networks, bioinformatics, healthcare, transportation and criminology. Highlighting the Importance of Big Data Management and Analysis for Various Applications will provide the reader with an understanding of how data management and analysis are adapted to these applications. This book will appeal to researchers and professionals in the field.

2014 International Conference on Computer, Network, Network Aug 17 2022 The objective of the 2014 International Conference on Computer, Network Security and Communication Engineering (CNSCE2014) is to provide a platform for all researchers in the field of Computer, Network Security and Communication Engineering to share the most advanced knowledge from both academic and industrial world, to communicate with each other about their experience and most up-to-date research achievements, and to discuss issues and future prospects in these fields. As an international conference mixed with academia and industry, CNSCE2014 provides attendees not only the free exchange of ideas and challenges faced by these two key stakeholders and encourage future collaboration between members of these groups but also a good opportunity to make friends with scholars around the world. As the first session of the international conference on CNSCE, it covers topics related to Computer, Network Security and Communication Engineering. CNSCE2014 has attracted many scholars, researchers and practitioners in these fields from various countries. They take this chance to get together, sharing their latest research achievements with each other. It has also achieved great success by its unique characteristics and strong academic atmosphere as well as its authority.

*User Perceptions of Network Management* Nov 27 2020 Numerous trade magazines articles vendor announcements, and trade show sessions have effectively acted as a unified medium for spreading the network management word. The result is that user awareness

Internetworking and Computing Over Satellite Networks Jul 24 2020 The emphasis of this text is on data networking, internetworking and distributed computing issues. The material surveys recent work in the area of satellite networks, introduces certain state-of-the-art technologies, and presents recent research results in these areas.

First Results from the Fennoscandian GPS Networks Jun 22 2020 Temporal correlations were measured of data obtained by the Swedish Permanent GPS Network for Positioning (SWEPOS). The model for correlations,  $r(\Delta t) = \exp(-(\text{absolute value of } (\Delta t))/\tau)$ , can be used to predict precision of averaged values for different values of  $\tau$ . Results indicate that  $\tau$  is approximately equal to 1 day ( $r$  less than 1% after 5 days). The results show that the network can be used in geophysical applications such as the DOSE investigation on postglacial rebound. Johansson, J. M. and Jaldehag, R. T. K. ...
