Experts in herbicide research and development - chemists and plant physiologists -, have written 15 chapters that review all aspects pertinent to peroxidizing herbicides, compounds of topical interest since extremely low use rates ensure high environmental safety. Topics covered include structure-activity relationships, relevant patent literature, preparative methods, modes of action, greenhouse screening, laboratory assays, plant pigment biochemistry, and enzymology of the decisive target enzyme of this class of herbicides. This comprehensive

review will be welcomed as a unique and timely compilation of the current status of peroxidizing herbicide research and development. It will be of interest to professional chemists and biologists in agrochemical companies, universities and agricultural colleges. Developed from a symposium at the 206th National Meeting of the American Chemical Society, held in Chicago, August 1993. About two-thirds of the volume discusses the use of porphyrinic pesticides as herbicides. Various chapters deal with the synthesis, chemical structures, quantitative structure-activity relationships, and mode of action of porphyrinic herbicides. The rest of the volume details the effects of porphyrins and porphyrinogenic compounds on animals. The use of porphyrins and porphyrinogenic compounds as insecticides and pharmaceuticals and their mammalian toxicology are covered. Annotation copyright by Book News, Inc., Portland, OR Human pluripotent stem cells (hPSCs), which cover both human embryonic stem cells (hESCs) and induced pluripotent stem cells (iPSCs), show promise for drug discovery and regenerative medicine applications. These stem cells cannot be cultured on conventional tissue culture dishes but on biomaterials that have specific interactions with the hPSCs. Differentiation is regulated by the biological and physical cues conferred by the biomaterial. This book provides a systematic treatment of these topics bridging the gap between fundamental

biomaterials research of stem cells and their use in clinical trials. The author looks at hPSC culture on a range of biomaterial substrates. Differentiation and control of hESCs and iPSCs into cardiomyocytes, osteoblasts, neural lineages and hepatocytes are covered. The author then considers their translation into stem cell therapies and looks at clinical trials across spinal cord injury, macular degeneration, bone disease and myocardial infarction. Finally, a chapter on future directions closes the book. By using this book, the reader will gain a robust overview of current research and a clearer understanding of the status of clinical trials for stem cell therapies. Plant-parasitic nematodes are among the most destructive plant pathogens, causing enormous losses to agronomic crops worldwide. This book provides an up-to-date review of research related to two of the most important nematode pests, root-knot and cyst nematodes. Chapters cover early plant-nematode interactions, identification of nematode proteins important in the establishment of nematode feeding sites, and classification of biochemical and signaling pathways significant in the development of specialized feeding sites in the host. The cellular and subcellular structures essential for the parasitic interaction are examined by light and electron microscopy. Modern techniques of gene expression analyses and genomic sequencing are poised to provide an even greater wealth of information to researchers, enabling them to develop and examine natural and manmade mechanisms of resistance to this important plant pest. Vascular diseases are the leading cause of death worldwide. Distinguished clinical and surgical approaches have attempted to overcome its morbidity and mortality; still 17.9 million people die every year due to vascular affections. Stem cell therapy has emerged as a promising therapeutic strategy. Stem cells synthesize and secrete cytokines that promote cell recruitment, immunomodulation, extracellular matrix remodeling, angiogenesis, and

neuroregeneration, all of which promote regeneration. Besides that, stem cells are also capable of differentiating in various cell types, being employed in tissue engineering. Preclinical and clinical investigations have reported efficacy of stem cell therapy for various vascular diseases. Even though results are encouraging, the studies demonstrate variation in stem cell type and origin, route and protocol for administration, and concomitant use of other treatment strategies, impairing easy interpretation of results and clinical application. The purpose of this book is to compile and comprise the current state of the evidence regarding stem cell therapy for each vascular disease, elucidating possible clinical applications. More than an objective guide for readers on the use of this novel treatment strategy, this publication will advocate for stem cell therapy use and development and will be of significant interest to physicians in a wide range of disciplines as well as researchers. Vols. for 1955-1962 include: Mining guidebook and buying directory. This book reviews the current knowledge on tunable hydrogels, including the range of different materials and applications, as well as the existing challenges and limitations in the field. It covers various aspects of the material design, particularly highlighting biological responsiveness, degradability and responsiveness to external stimuli.
